

Databases

Lecture 3

The Relational Model (II)

Querying Relational Databases Using SQL

Managing Relational Databases with SQL

- ALTER TABLE – changes the structure of a defined table

ALTER TABLE table_name operation

```
ALTER TABLE Students  
ADD FavSymphony VARCHAR(50)
```

- possible operations (differences among DBMSs)
 - add / change / remove a column
 - ADD column_definition
 - {ALTER COLUMN | MODIFY} column_definition
 - DROP COLUMN column_name

Managing Relational Databases with SQL

- add / remove a constraint
 - ADD [CONSTRAINT constraint_name] PRIMARY KEY(column_list)
 - ADD [CONSTRAINT constraint_name] UNIQUE(column_list)
 - ADD [CONSTRAINT constraint_name] FOREIGN KEY (column_list) REFERENCES table_name[(column_list)] [ON UPDATE action] [ON DELETE action]
 - DROP [CONSTRAINT] constraint_name

Managing Relational Databases with SQL

- DROP TABLE – removes a table

DROP TABLE table_name

```
DROP TABLE Students
```

- **Data Definition Language (DDL)** - subset of SQL used to create / remove / change components (e.g., tables)

Managing Relational Databases with SQL

- changing data in a table
- the INSERT command – adding records

```
INSERT INTO table_name[(column_list)] VALUES (value_list)
```

```
INSERT INTO table_name[(column_list)] subquery,
```

where *subquery* refers to a set of records (generated with the SELECT statement)

```
INSERT INTO Students (sid, cnp, lastname, firstname, age)  
VALUES (1, '123456789012', 'Popescu', 'Maria', 20)
```

Managing Relational Databases with SQL

- changing data in a table
- the UPDATE command – changing records

UPDATE table_name

SET column_name=expression [, column_name=expression] ...

[WHERE condition]

- the command changes the records in the table that satisfy the condition in the WHERE clause; if the WHERE clause is omitted, all the records in the table are changed; the values of the columns specified in SET are changed to the associated expressions' values

```
UPDATE Students
```

```
SET age = age + 1
```

```
WHERE cnp = '123456789012'
```

Managing Relational Databases with SQL

- changing data in a table
- the DELETE command – removing records

```
DELETE FROM table_name  
[WHERE condition]
```

- the command deletes the records in the table that satisfy the condition in the WHERE clause; if the WHERE clause is omitted, all the table's records are deleted

```
DELETE  
FROM Students  
WHERE lastname = 'Popescu'
```

- **Data Manipulation Language (DML)** - subset of SQL used to pose queries, to add / update / remove data

Managing Relational Databases with SQL

- **filter conditions**

- expression comparison_operator expression
- expression [NOT] BETWEEN valmin AND valmax
- expression [NOT] LIKE pattern ("% " - any substring, "_" - one character)
- expression IS [NOT] NULL
- expression [NOT] IN (value [, value] ...)
- expression [NOT] IN (subquery)
- expression comparison_operator {ALL | ANY} (subquery)
- [NOT] EXISTS (subquery)

Managing Relational Databases with SQL

- 3-valued logic (truth values: *true*, *false*, *unknown*)

	TRUE	FALSE	NULL
NOT	FALSE	TRUE	NULL

AND	TRUE	FALSE	NULL
TRUE	TRUE	FALSE	NULL
FALSE	FALSE	FALSE	FALSE
NULL	NULL	FALSE	NULL

OR	TRUE	FALSE	NULL
TRUE	TRUE	TRUE	TRUE
FALSE	TRUE	FALSE	NULL
NULL	TRUE	NULL	NULL

Pirates

PId	PName	ShipId	...
P1	Jack Sparrow	1	
P2	Elizabeth Swann	2	
P3	NULL	1	

UPDATE Pirates
 SET ShipId = 3
 WHERE PName = 'Jack Sparrow'

PId	PName	ShipId	...
P1	Jack Sparrow	1 3	
P2	Elizabeth Swann	2	
P3	<u>NULL</u>	1	

NULL = "we don't know"
 So the condition evaluates
 to "UNKNOWN", not false,
 but not true either

Managing Relational Databases with SQL

- **filter conditions**

- elementary condition (previously described)
- (condition)
- NOT condition
- condition₁ AND condition₂
- condition₁ OR condition₂

Querying Relational Databases Using SQL

- basic SELECT query:

SELECT [DISTINCT] select-list

FROM from-list

WHERE qualification

- **select-list**

- list of (expressions involving) attributes from relations in the **from-list**

- **from-list**

- list of relation names; each of them can be followed by a range variable

- **qualification**

- selection conditions on the data from the relations in the **from-list**
- conditions (*expr op expr*, where $op \in \{<, \leq, =, >, \geq, \neq\}$ and *expr* is an expression that can include attributes, constants, etc) combined with the logical operators AND, OR, NOT

- **basic SELECT query:**

```
SELECT [DISTINCT] select-list  
FROM from-list  
WHERE qualification
```

- the SELECT, FROM clauses - mandatory
- the WHERE clause - optional

- the conceptual evaluation strategy:

```
SELECT [DISTINCT] select-list
```

```
FROM from-list
```

```
WHERE qualification
```

- compute the cross product of tables in the **from-list**
- remove the rows that don't meet **qualification**
- eliminate unwanted columns, i.e., those that don't appear in the **select-list**
- if DISTINCT is specified, remove duplicates
 - by default, duplicates are not eliminated

- examples on the schema

Researchers(*RID*: integer, *Name*: string, *ImpactFactor*: integer, *Age**: integer)

Papers(*PID*: integer, *Title*: string, *Conference*: string)

AuthorContribution(*RID*: integer, *PID*: integer, *Year*: integer)

$r_1, p_1, 2019$

$r_2, p_1, 2020$

$r_1, p_1, 2021$

$r_2, p_1, 2021$

* we use the *Age* attribute for simplicity; it is preferable to store the date of birth, as it doesn't change every year

- Find the names of researchers who have worked on the paper with PID = 307.

```
SELECT R.Name
FROM Researchers R AuthorContribution A
WHERE R.RID = A.RID AND A.PID = 307
```

Handwritten note: "alias" with an arrow pointing to the circled 'R' in the FROM clause.

Researchers

RID	Name	ImpactFactor	Age
* 1	Popescu	10	30
* 2	Ionescu	10	40
4	Andreescu	5	24

AuthorContribution

RID	PID	Year
1	<u>307</u>	2011
1	200 ✗	2012
2	307	2011

- compute the cross product of tables *Researchers* and *AuthorContribution*
** all lines in the first table with every row in the 2nd table*

RID	Name	ImpactFactor	Age	RID	PID	Year
1	Popescu	10	30	1	307	2011
1	Popescu	10	30	1	200	2012
1	Popescu	10	30	2	307	2011
2	Ionescu	10	40	1	307	2011
2	Ionescu	10	40	1	200	2012
2	Ionescu	10	40	2	307	2011
4	Andreescu	5	24	1	307	2011
4	Andreescu	5	24	1	200	2012
4	Andreescu	5	24	2	307	2011

- RID* appears in both *Researchers* and *AuthorContribution* => it must be qualified (e.g., in the WHERE clause)

- remove the rows in the cross product that don't satisfy the condition $R.RID = A.RID$ AND $A.PID = 307$

RID	Name	ImpactFactor	Age	RID	PID	Year
1	Popescu	10	30	1	307	2011
1	Popescu	10	30	1	200	2012
1	Popescu	10	30	2	307	2011
2	Ionescu	10	40	1	307	2011
2	Ionescu	10	40	1	200	2012
2	Ionescu	10	40	2	307	2011
4	Andreescu	5	24	1	307	2011
4	Andreescu	5	24	1	200	2012
4	Andreescu	5	24	2	307	2011

- remove the rows in the cross product that don't satisfy the condition
 $R.RID = A.RID \text{ AND } A.PID = 307$

RID	Name	ImpactFactor	Age	RID	PID	Year
1	Popescu	10	30	1	307	2011
1	Popescu	10	30	1	<u>200</u>	2012
1	Popescu	10	30	2	307	2011
2	Ionescu	10	40	1	307	2011
2	Ionescu	10	40	1	<u>200</u>	2012
2	Ionescu	10	40	2	307	2011
4	Andreescu	5	24	1	307	2011
4	Andreescu	5	24	1	<u>200</u>	2012
4	Andreescu	5	24	2	307	2011

- remove the rows in the cross product that don't satisfy the condition
 $R.RID = A.RID$ AND $A.PID = 307$

RID	Name	ImpactFactor	Age	RID	PID	Year
1	Popescu	10	30	1	307	2011
1	Popescu	10	30	1	200	2012
1	Popescu	10	30	2	307	2011
2	Ionescu	10	40	1	307	2011
2	Ionescu	10	40	1	200	2012
2	Ionescu	10	40	2	307	2011
4	Andreescu	5	24	1	307	2011
4	Andreescu	5	24	1	200	2012
4	Andreescu	5	24	2	307	2011

- remove the rows in the cross product that don't satisfy the condition
 $R.RID = A.RID \text{ AND } A.PID = 307$

RID	Name	ImpactFactor	Age	RID	PID	Year
1	Popescu	10	30	1	307	2011
2	Ionescu	10	40	2	307	2011

- remove the columns that don't appear in R.Name

Name
Popescu
Ionescu

- basic queries

Find the names and ages of all researchers. Eliminate duplicates.

```
SELECT DISTINCT R.Name, R.Age  
FROM Researchers R
```

select-list

from-list

Find the researchers with an impact factor > 3 (all the data about researchers).

```
SELECT R.RID, R.Name, R.ImpactFactor, R.Age  
FROM Researchers AS R  
WHERE R.ImpactFactor > 3  
-- SELECT *
```

Find the names of researchers who have published in the EDBT conference.

```
SELECT R.Name  
FROM Researchers R, AuthorContribution A, Papers P  
WHERE R.RID = A.RID AND A.PID = P.PID AND P.Conference =  
'EDBT'
```

Ionescu, Popescu

Find the ids of researchers who have published in the EDBT conference.

```
SELECT A.RID  
FROM AuthorContribution A, Papers P  
WHERE A.PID = P.PID AND P.Conference = 'EDBT'
```

1, 2

Researchers

RID	Name	ImpactFactor	Age
1	Ionescu	10	30
2	Popescu	10	40
4	Andreescu	2	24

Papers

PID	Title	Conference
1	t1	EDBT
7	t2	IDEAS
9	t3	EDBT

AuthorContribution

RID	PID	Year
1	1	2011
1	7	2012
2	7	2011
2	9	2019

✓
✗
✓

Find the names of researchers who have published at least one paper.

```
SELECT R.Name  
FROM Researchers R, AuthorContribution A  
WHERE R.RID = A.RID
```

enough since we have PID

Find the conferences that published Ionescu's papers.

```
SELECT P.Conference  
FROM Researchers R, AuthorContribution A, Papers P  
WHERE R.RID = A.RID AND A.PID = P.PID AND R.Name = 'Ionescu'
```

EDBT, IDEAS

* **obs. There can be more than one researcher named Ionescu.**

because Name is not RID or unique

- expressions in SELECT

→ also need Researchers

Compute an incremented impact factor for researchers who worked on two different papers in the same year.

SELECT R.Name, R.ImpactFactor + 1 AS NewIF

→ the new column doesn't have a name otherwise

* name appears 2 times
⇒ alias is a must

FROM Researchers R, AuthorContribution A1, AuthorContribution A2

WHERE R.RID = A1.RID AND R.RID = A2.RID

→ researcher appears into 2 author contributions

AND A1.PID <> A2.PID

diff papers

AND A1.Year = A2.Year

same year

AuthorContribution

RID	PID	Year
1	1	2011
1	7	2011
2	7	2011
2	9	2019

- nested queries
 - the WHERE clause
- IN

Find the names of researchers who have worked on the paper with PID = 307.

SELECT R.Name

FROM Researchers R

WHERE R.RID **IN** (SELECT A.RID
FROM AuthorContribution A
WHERE A.PID = 307)

computes a table
to be used

a set of RIDs of
researchers P_{id}=307

Name
Popescu
Andreescu

Researchers

RID	Name	ImpactFactor	Age
1	Ionescu	10	30
2	Popescu	10	40
4	Andreescu	2	24

AuthorContribution

RID	PID	Year
1	1	2011
1	307	2012
2	1	2011
4	307	2012

Find the names of researchers who have published in EDBT.

```
SELECT R.Name
FROM Researchers R
WHERE R.RID IN
    (SELECT A.RID
     FROM AuthorContribution A
     WHERE A.PID IN
         (SELECT P.PID
          FROM Papers P
          WHERE P.Conference = 'EDBT'
         )
    )
```

Researchers who contributed on those papers

1,2

- other JOIN expressions

source1 [alias1] JOIN source2 [alias2] USING (column_list)

source1 [alias1] NATURAL JOIN source2 [alias2]

source1 [alias1] CROSS JOIN source2 [alias2]

- subquery in the FROM clause

```
SELECT R.*  
FROM Researchers R INNER JOIN  
    (SELECT *  
     FROM AuthorContribution A  
     WHERE A.PID = 400) t  
ON R.RID = t.RID
```

include data only from researchers

intermediate table that gets

- copy data from one table to another

```
INSERT INTO T2
```

```
SELECT * FROM T1
```

- **GROUP BY, HAVING**

```
SELECT [DISTINCT] select-list  
FROM from-list  
WHERE qualification  
GROUP BY grouping-list  
HAVING group-qualification
```

- optional GROUP BY clause
 - list of (expressions involving) columns used for grouping
- optional HAVING clause
 - group qualification conditions
- aggregation operators

COUNT, AVG, SUM, MIN, MAX

- **GROUP BY, HAVING**

```
SELECT [DISTINCT] select-list  
FROM from-list  
WHERE qualification  
GROUP BY grouping-list  
HAVING group-qualification
```

- **group**

- a collection of rows with identical values for the columns in **grouping-list**
- every row in the result of the query corresponds to a group

- **GROUP BY, HAVING**

```
SELECT [DISTINCT] select-list  
FROM from-list  
WHERE qualification  
GROUP BY grouping-list  
HAVING group-qualification
```

- **select-list**

- columns (that must appear in **grouping-list**)
- terms of the form *aggop(column) [AS NewName]*
 - e.g., MAX(R.ImpactFactor) AS MaxImpactFactor
 - *NewName* assigns a name to the column in the result table

- **GROUP BY, HAVING**

```
SELECT [DISTINCT] select-list  
FROM from-list  
WHERE qualification  
GROUP BY grouping-list  
HAVING group-qualification
```

- **group-qualification**

- expressions with a single value / group
- a column in **group-qualification** appears in **grouping-list** or as an argument to an aggregation operator
- records that meet **qualification** are partitioned into groups based on the values of the columns in **grouping-list**
- an answer row is generated for every group that meets **group-qualification**

Find the age of the youngest researcher for each impact factor.

```
SELECT R.ImpactFactor, MIN(R.Age)
```

```
FROM Researchers R
```

```
GROUP BY R.ImpactFactor
```

→ collection of rows that agree on the column that appears in the GROUP BY clause
i.e. impact factor

RID	Name	ImpactFactor	Age
1	Ionescu	10	30
2	Popescu	10	40
4	Andreescu	2	24
5	Vladescu	2	24

10, 30
2, 24

* discussion: using the GROUP BY clause vs writing n queries, one for each of the n values of the impact factor, where n depends on the relation instance

→ For every group, the result will have only ONE ROW, computed in the select

Find the age of the youngest researcher who is at least 18 years old for each impact factor with at least 10 such researchers.

```
SELECT R.ImpactFactor, MIN(R.Age) AS MinAge
```

```
FROM Researchers R
```

```
WHERE R.Age >= 18 of voting age
```

```
GROUP BY R.ImpactFactor
```

```
HAVING COUNT(*) >= 10
```

} from each "impact factor" group with at least 10 researchers

4, 25

10, 19

See seminar 2:

- range variables
- the LIKE operator
- the UNION [ALL], INTERSECT, EXCEPT operators
- joins with more than 2 tables
- aggregation operators
